

ILLUMI-WELD™

We developed Illumi-WELD to easily integrate into most of the current welding helmets on the market today. Unfortunately there is not a one size fits all design. There are too many different shapes of helmets available. We do know that most helmets from the same manufacturer share the same shell or at least a close match across model numbers within that product line.

Illumi-WELD mounts into the one place that will never get in your way, the chin of your welding helmet. Since most chin areas are already rounded for rigidity, we gave the face plate and lens holder a rounded shape. This allows integration into a wide variety of helmets regardless of the roundness of the chin as it will conform to Illumi-WELD during mounting.

To confirm that Illumi-WELD will fit your helmet cut out the shape below and line it up against the inside area of the chin where you would like to install the light. If it is close it will fit as the hood will form to the shape of the light when screwed together. See picture below for reference.
